## EXAM PROFESSIONAL DATA ENGINEER TOPIC 1 QUESTION 63 DISCUSSION

Actual exam question from Google's Professional Data Engineer

Question #: 63

Topic #: 1

[\[All Professional Data Engineer Questions\]](#)

You have some data, which is shown in the graphic below. The two dimensions are X and Y, and the shade of each dot represents what class it is. You want to classify this data accurately using a linear algorithm. To do this you need to add a synthetic feature. What should the value of that feature be?

- A.  $X^2 + Y^2$
- B.  $X^2$
- C.  $Y^2$
- D.  $\cos(X)$

For fitting a linear classifier when the data is in a circle use A.

Selected Answer: A

I think A should be  $x^2+y^2$ . We need a circle to classify the data.

Selected Answer: A

Just a note, they are using  $X^2$  and  $Y^2$  to mean  $X^{\text{squared}}$ , and  $Y^{\text{squared}}$ . This is a circle in the form  $X^2+Y^2 = k$ , so for a given  $k$  will split that dataset nicely.

It's not obvious to me it is A.

As others said,  $\cos(X)$  does ignore the  $Y$  value. But answer A does not seem good either. The differences seem minimal.

If you do A then you have the following issues. If you take elements in the bottom right or the top left of the circle, they will all have the same value, ZERO. Not only that, they will actually have the same value with the elements in the middle of the circle which are completely black. Moreover, elements on the extreme right and extreme left will have different values ( $-x_{\text{max}}$  and  $+x_{\text{max}}$ ).

However, if you use a  $\cos(x)$  then the elements in the beginning

Nevermind I did not understand that  $X^2$  and  $Y^2$  meant  $X^{\text{^2}}$  and  $Y^{\text{^2}}$ . Answer is A because that gives the distance from the circle. Circle radius =  $\sqrt{X^2 + Y^2}$ . So even though it's not a perfect answer, it makes sense.

A.  $X^2+Y^2$

The synthetic feature that should be added in this case is the squared value of the distance from the origin (0,0). This is equivalent to  $X^2+Y^2$ . By adding this feature, the classifier will be able to make more accurate predictions by taking into account the distance of each data point from the origin.

$X^2$  and  $Y^2$  alone will not give enough information to classify the data because they do not take into account the relationship between  $X$  and  $Y$ .

D.  $\cos(X)$  is not a suitable option because it does not take into account the  $Y$  coordinate.

A is the correct answer as graph of circle is  $x^2 + y^2$

   upvoted 2 times

  **desertlotus1211** 2 years, 3 months ago

Answer is A:

The answer reflects 'x' to the 2nd power + 'y' the 2nd power.

I guess they can't use carots in the exam answers!

If the shape was a circle, it would be  $(x^2 + y^2)$ . But I think that a quadric curve will do a better job of separating the two classes, so it would be  $(x^2)$

$F(x)$  as A B C will have always a positive values as result, for A will need a third dimension Z to represent data, only  $D:\cos(x)$  can be presented as the shown classification. this is a math question
